Peering Infrastructures are critical part of the interconnection ecosystem

Internet Exchange Points (IXPs) provide a shared switching fabric for layer-2 bilateral and multilateral peering.

- Largest IXPs support > 100 K of peerings, > 5 Tbps peak traffic
- Typical SLA 99.99% (~52 min. downtime/year)¹

Carrier-neutral **co-location facilities** (CFs) provide infrastructure for physical co-location and cross-connect interconnections.

- Largest facilities support > 170 K of interconnections
- Typical SLA 99.999% (~5 min. downtime/year)²

Equinix cooling outage leads to flight delays in Australia

13 November 2012 · By Penny Jones

in Shares Tweet Like 0

A "short interruption to utility power supply" at an Equinix data center in Sydney caused up to three hour delays for thousands of passengers flying with three major airlines from Australian airports over the weekend.

[outages] Power problems at the Westin in SEA?

Sean Crandall [sean at megapath.com](mailto:sean@megapath.com)

Hi everyone...

We appear to be having power problems in the Westin in Seattle and have heard reports of other colo providers having power issues which implies it is a greater building problem.

[Is anyone else having power issues in the Westin?](#)

[outages] So what is broken

- Next message (by thread): [\[outages\] Telehouse North - Major Problems](#)
- Messages sorted by: [\[date\]](#) [\[thread\]](#) [\[subject\]](#) [\[author\]](#)

We've just had 3 links drop simultaneously to (different) equipment in Telehouse North.

Fibre link to Vodafone - port is down
BGP peering to GTT is dropped
Copper link to BT - port is down

[Anyone else seeing anything?](#) We spoke to BT and they have confirmed a "major national problem".

- ASes try to crowd-source the detection and localization of outages.
- Inadequate transparency/responsiveness from infrastructure operators.

Our Research Goals

1. Outage detection:
 - *Timely, at the finest granularity possible*
2. Outage localization:
 - Distinguish *cascading effects* from outage *source*
3. Outage tracking:
 - Determine duration, shifts in routing paths, geographic spread

Passive outage detection: Initialization

For each vantage point (VP) collect all the **stable** BGP routes tagged with the communities of the target facility (Facility 2)

Passive outage detection: Initialization

For each vantage point (VP) collect all the **stable** BGP routes tagged with the communities of the target facility (Facility 2)

Passive outage detection: **Monitoring**

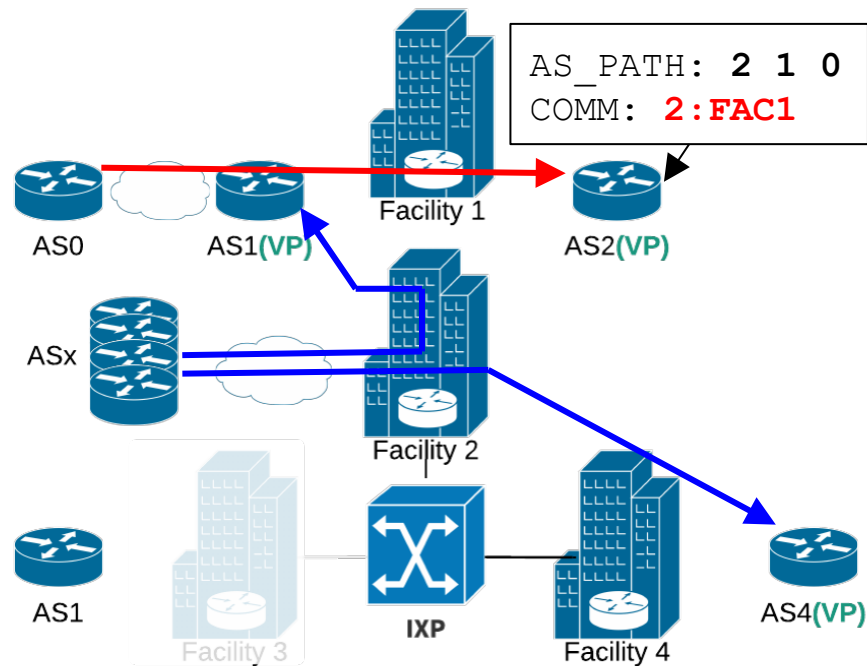

Track the BGP updates of the stable paths for changes in the communities values that indicate ingress point change.

Passive outage detection: **Monitoring**

We don't care about AS-level path changes if the ingress-tagging communities remain the same.

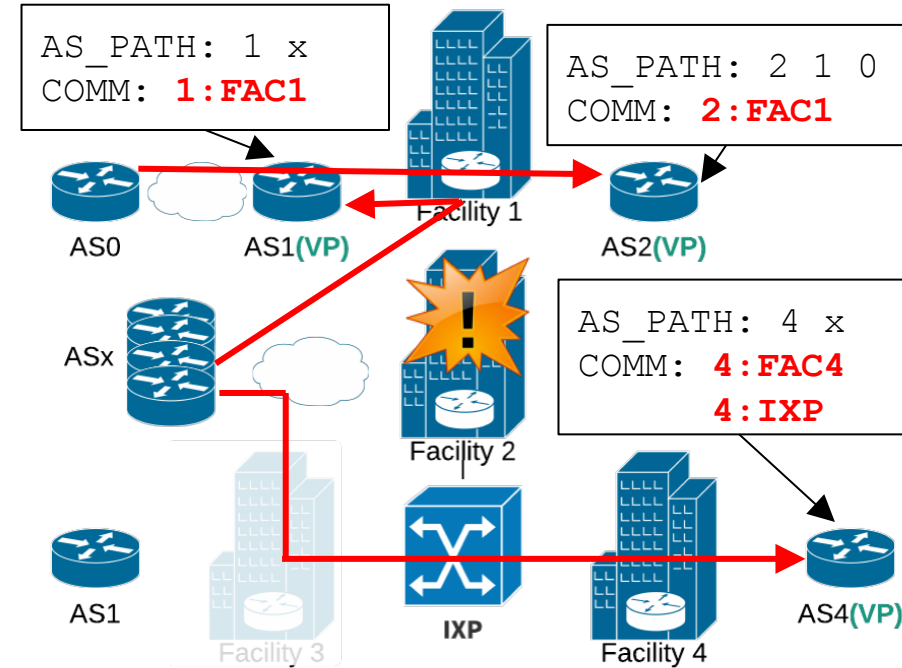

Passive outage detection: **Outage signal**

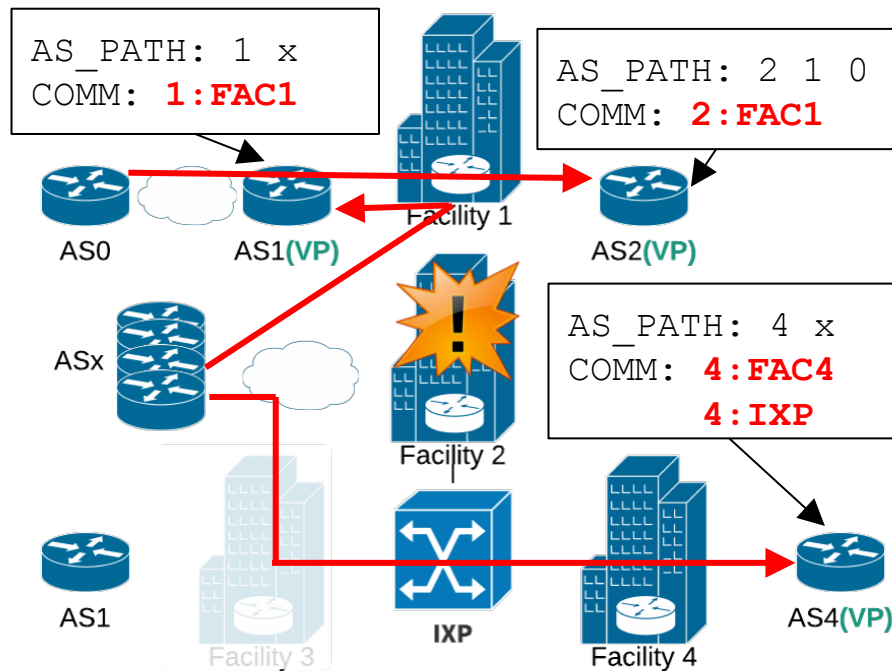

- Concurrent changes of communities values for the same facility.
- **Indication** of outage but not final inference yet!

Passive outage detection: **Outage signal**

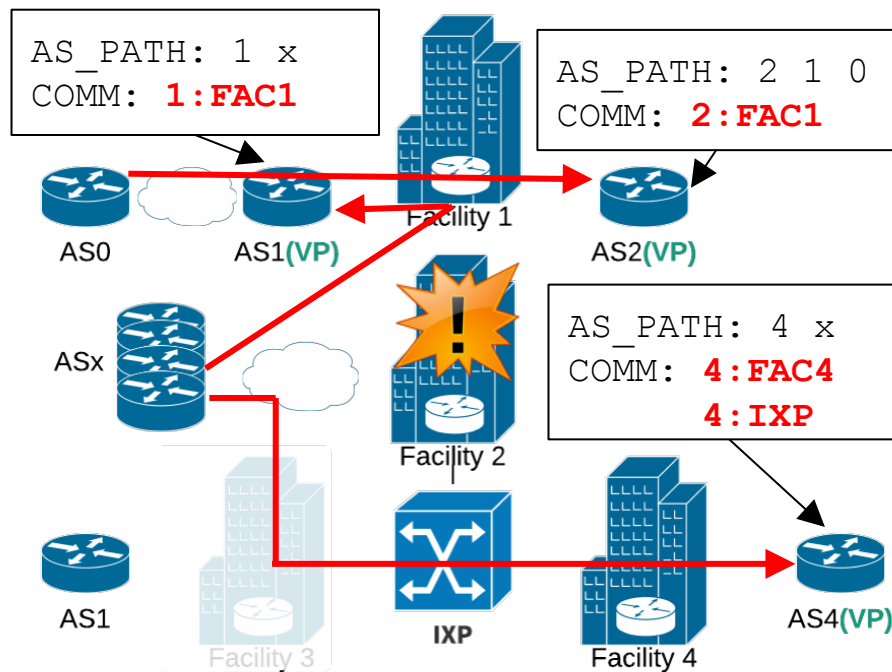

- Concurrent changes of communities values for the same facility.
- **Indication** of outage but not final inference yet!

Passive outage detection: **Outage signal**

- Concurrent changes of communities values for the same facility.
- **Indication** of outage but not final inference yet!

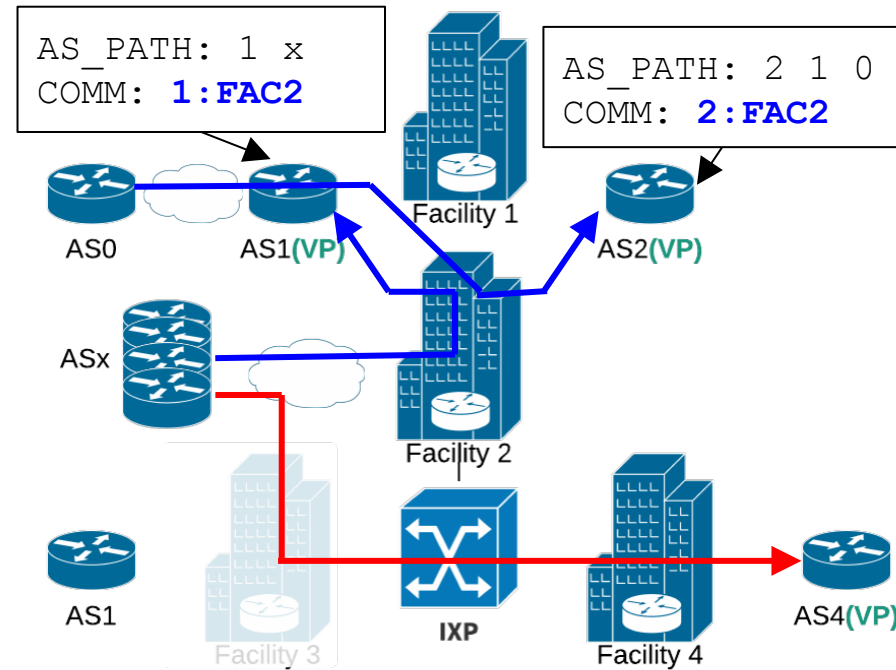

Passive outage detection: **Outage signal**

Signal investigation:

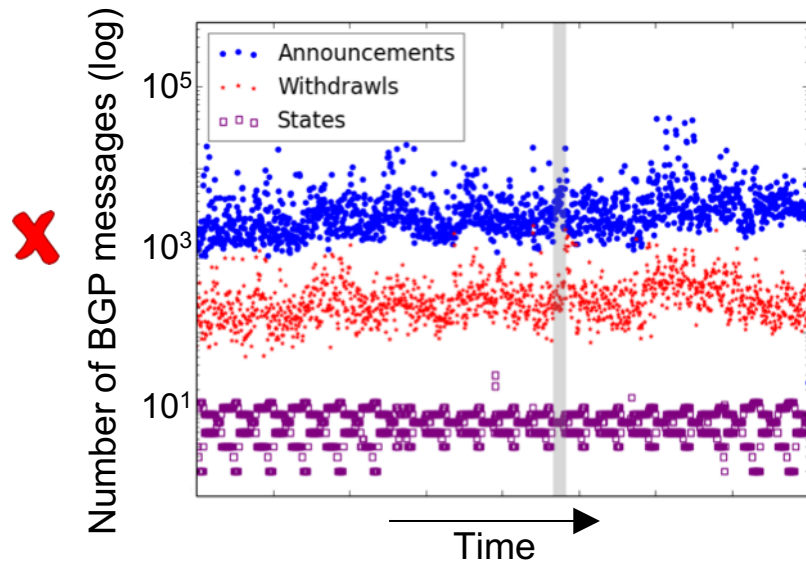

- Targeted active measurements.
- How disjoint are the affected paths?
- How many ASes and links have been affected?

Passive outage detection: Outage tracking

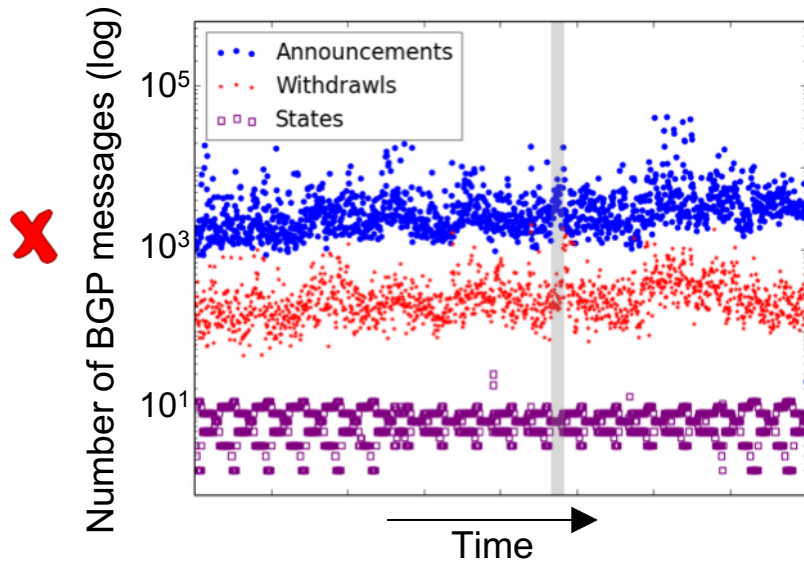

End of outage inferred when the majority of paths return to the original facility.

De-noising of BGP routing activity

The aggregated activity of BGP messages (updates, withdrawals, states) provides no outage indication.

De-noising of BGP routing activity

The aggregated activity of BGP messages (updates, withdrawals, states) provides no outage indication.

The BGP activity filtered using communities provides **strong outage signal**.

Outage localization is more complicated!

- The location of community values that trigger outage signals may not be the outage source!
- Communities encode the ingress point closest to our VPs (near-end infrastructure)
 - ASes may be interconnected over multiple intermediate infrastructures
 - Failures in intermediate infrastructures may affect the near-end infrastructure paths

Outage localization is more complicated!

Outage localization is more complicated!

Outage localization is more complicated!

Outage localization is more complicated!

Outage localization is more complicated!

Outage source disambiguation and localization

- Create **high-resolution co-location maps**:
 - AS to Facilities, AS to IXPs, IXPs to Facilities
 - Sources: PeeringDB, DataCenterMap, operator websites
- Decorrelate the behaviour of affected ASes based on their infrastructure colocation.

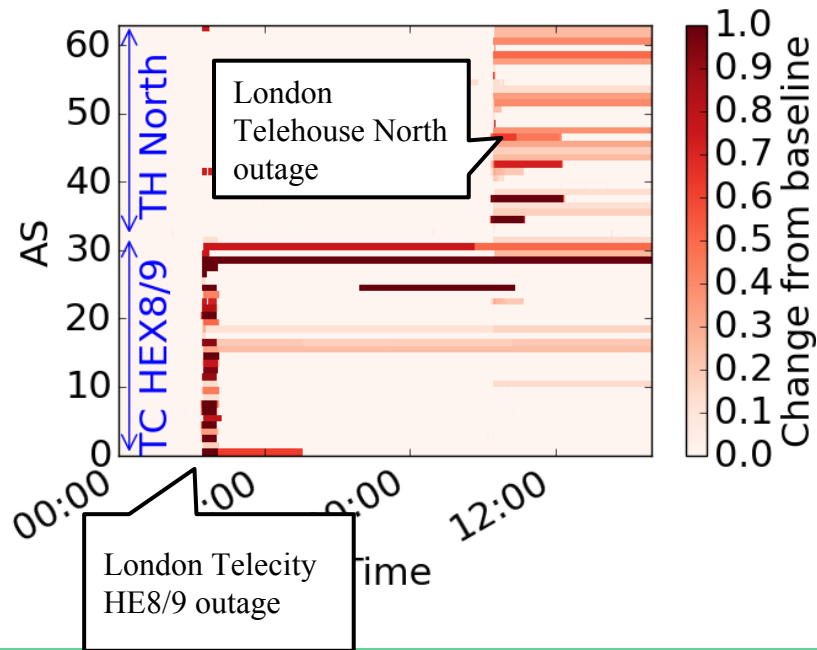

Outage source disambiguation and localization

Paths not investigated in aggregated manner, but at the granularity of separate (AS, Facility) co-locations.

Outage source disambiguation and localization

Paths not investigated in aggregated manner, but at the granularity of separate (AS, Facility) co-locations.

Tracking the progress of outages

Passive tracking:

Monitor how location-tagging BGP Communities change during the outage.

Active tracking:

Execute **targeted traceroutes** based on the hints of the BGP signals.

Detecting peering infrastructure outages in the wild

- **159** outages in 5 years of BGP data
 - **76%** of the outages not reported in popular mailing lists/websites
- Validation through status reports, direct feedback, social media
 - **90%** accuracy, **93%** precision (for trackable PoPs)

Effect of outages on Service Level Agreements

~70% of failed facilities below 99.999% uptime

~50% of failed IXPs below 99.99% uptime

5% of failed infrastructures below 99.9% uptime!

Measuring the impact of outages

> **56 %** of the affected links in different country, > **20%** in different continent!

Median RTT rises by > **100 ms** for rerouted paths during AMS-IX outage.

Conclusions

- **Timely** and **accurate** infrastructure-level outage detection through **passive** BGP monitoring
- Majority of outages not (widely) reported
- Remote peering and infrastructure interdependencies **amplify** the impact of local incidents
- **Hard evidence** on outages can improve accountability, transparency and resilience strategies

Questions / Comments?

Challenges in detecting infrastructure outages

1. Capturing the infrastructure-level hops between ASes
2. Correlating the paths from multiple vantage points
3. Continuous monitoring of the routing system

Passive BGP monitoring 🤔
